

17. Deliverables

The **Deliverables section** defines all the final outputs produced during the API testing project. These deliverables act as **evidence of testing work**, and are very important for:

- QA documentation
- Interview discussion
- Project portfolio
- Client reporting

In this project using Fake Store API, we generated multiple artifacts using Postman and Newman CLI.

17.1 Postman Collection JSON

◆ What it is?

A **Postman Collection JSON** is the exported file that contains:

- All API requests
 - Folder structure (Authentication, Products, Cart, Users)
 - Test scripts (JavaScript assertions)
 - Pre-request scripts
 - Request configurations
-

◆ Purpose:

- Reusability of API test cases
 - Sharing with team members
 - Importing into Postman anytime
 - Running in Newman CLI
-

◆ Example:

```
{
  "info": {
    "name": "Fake Store API Collection"
  },
  "item": [
    {
      "name": "Products",
```

```
    "item": []  
  }  
]  
}
```

17.2 Environment JSON

◆ What it is?

Environment file stores **dynamic variables** used across APIs.

Examples:

- baseUrl
 - authToken
 - productId
 - cartId
-

◆ Purpose:

- Avoid hardcoding values
 - Enable multiple environments (QA/Dev/Prod)
 - Support automation execution in Newman
-

◆ Example:

```
{  
  "baseUrl": "https://fakestoreapi.com",  
  "authToken": "",  
  "productId": ""  
}
```

17.3 Newman CLI Execution Result

◆ What it is?

This is the **terminal output generated after running Newman tests**.

It contains:

- Total requests executed

- Passed tests
 - Failed tests
 - Response time
 - Assertion results
-

◆ Example command:

```
newman run collection.json -e environment.json
```

◆ Output includes:

- ✓ Pass count
 - ✗ Fail count
 - Execution summary
 - Error logs (if any)
-

17.4 Newman HTML Report

◆ What it is?

A visual report generated after Newman execution.

◆ Purpose:

- Easy analysis of test results
 - Graphical representation
 - Shareable QA report
 - Client-ready documentation
-

◆ Includes:

- Pass/Fail summary dashboard
- Response time graphs
- Request-by-request details
- Environment variables used

17.5 Screenshots

◆ What it is?

Screenshots taken during:

- API execution in Postman
- Test script validation
- Newman CLI run
- HTML report output

◆ Purpose:

- Proof of execution
- Interview documentation
- Debugging reference
- Visual evidence of testing

17.6 API Test Report

◆ What it is?

A structured document summarizing:

- Test cases executed
- Test scenarios
- Pass/fail status
- Observations
- Defects (if any)
- Final conclusion

◆ Contains:

◆ Test Summary

- Total test cases
- Passed/failed count

◆ Observations

- API behavior
- Response correctness

◆ Defects (if any)

- Functional issues
 - Data issues
 - Performance issues
-

◆ Purpose:

- Final QA deliverable
 - Used in client reporting
 - Used in project documentation
-
