
Logs Execution.log:

Purpose of Logs in Automation Framework

Logs are used to track every step that is executed during automation testing. In your SauceDemo Data Driven Testing project, logs help us understand

- what action was performed
- whether it passed or failed
- where exactly the failure occurred
- how data was processed from CSV file

In simple words

Logs act like a step by step diary of your automation execution

Where Logs Are Stored

In your project structure

12 Logs
Execution.log

This file contains all runtime information generated during test execution.

Why Logs Are Important

Logs help in

- Debugging failures without rerunning tests
- Understanding test flow execution
- Tracking data driven iterations
- Identifying issues in login functionality
- Providing evidence for interview explanation

What is Logged in Your Framework

In your SauceDemo automation framework, logs typically capture

Browser launch details
Application URL opening
Username and password entry
Login button click
Pass or fail status
Screenshot trigger for failures
CSV data reading information

Example of Execution.log Output

Here is a realistic example based on your project

Browser initialized successfully
Chrome browser launched
Navigated to <https://www.saucedemo.com>

Test data loaded from CSV file
Username standard_user read from row 1
Password secret_sauce read from row 1

Entered username in login field
Entered password in password field
Clicked on login button

Login successful
User redirected to Products page
Test case TC_001 PASSED

Now example for failure case

Browser initialized successfully
Navigated to SauceDemo application

Username invalid_user entered
Password secret_sauce entered
Clicked on login button

Error message displayed but expected redirection failed
User not navigated to Products page
Screenshot captured in Fail folder
Test case TC_002 FAILED

How Logging Works in Your Framework

In your project structure logging is handled in BaseClass and utilities

BaseClass handles start of execution logs

LoginTest records test step logs

ScreenshotUtil triggers logs during failure

CSVReader logs data iteration

Real Time Example Flow

When CSV file has 3 users

Row 1 valid user

Row 2 invalid user

Row 3 locked user

Logs will show

Execution started

Reading row 1

Login successful

Reading row 2

Login failed

Reading row 3

User locked out

This proves Data Driven Testing is working correctly
